EXPNO:1	SETTINGUPTHEENVIRONMENTANDPREPROCESSINGTHEDATA
---------	--

AIM:

To setup a fully functional machine learning development environment and to perform data preprocessing operations like handling missing values, encoding categorical variables, feature scaling, and splitting datasets.

ALGORITHM:

1. Install Required Libraries:
 - Install numpy, pandas, matplotlib, seaborn, and scikit-learn using pip.
2. Import Libraries.
3. Load Dataset:
 - Load any dataset (e.g., Titanic or Iris) using pandas.
4. Data Exploration:
 - Use `df.info()`, `df.describe()`, `df.isnull().sum()` to understand the data.
5. Handle Missing Values:
 - Use `fillna()` or `dropna()` depending on the strategy.
6. Encode Categorical Data:
 - Use `pd.get_dummies()` or `LabelEncoder`.
7. Feature Scaling:
 - Normalize or standardize the numerical features using `StandardScaler` or `MinMaxScaler`.
8. Split Dataset:
 - Use `train_test_split()` from `sklearn` to create training and testing sets.
9. Display the Preprocessed Data.

CODE:

```
#1.Installnecessarylibraries(ifnot alreadyinstalled)
#!pipinstallnumpypandasmatplotlibseabornscikit-learn

#2.Import
libraries
importpandasaspd
importnumpyasnp
fromsklearn.model_selectionimporttrain_test_split
fromsklearn.preprocessingimportStandardScaler,LabelEncoder
importseabornas sns
importmatplotlib.pyplotasplt

#3.Loaddataset
df=sns.load_dataset('titanic')#Titanicdataset
df.head()

#4.Explorethedata
print(df.info())
print(df.describe())
print(df.isnull().sum())

# 5.Handlemissingvalues
# Fill age with median, embark_town with mode
df['age'].fillna(df['age'].median(), inplace=True)
df['embark_town'].fillna(df['embark_town'].mode()[0],inplace=True)
df.drop(columns=['deck'], inplace=True)# too many missing
```

```
#Convert'sex'and'embark_town'usingLabelEncoder
le = LabelEncoder()
df['sex']= le.fit_transform(df['sex'])
df['embark_town']=le.fit_transform(df['embark_town'])

# Drop non-informativeor redundantcolumns
df.drop(columns=['embarked','class','who','alive','adult_male','alone'],inplace=True)

# 7. Feature Scaling
scaler=StandardScaler
()
numerical_cols=['age', 'fare']
df[numerical_cols] =scaler.fit_transform(df[numerical_cols])

#8.Splitdataset
#Definefeatures(X)andlabel(y)
X = df.drop('survived', axis=1)
y=df['survived']
X_train,X_test,y_train,y_test=train_test_split(X, y,test_size=0.2, random_state=42)

# 9. Show final preprocessed data
print("TrainingDataShape:",X_train.shape)
print("Test Data Shape:", X_test.shape)
```

OUTPUT:

```

RESULT:

The Python environment was successfully set up and the dataset was pre-processed by handling missing values, encoding categorical data, performing feature scaling, and splitting the data into training and testing sets. The dataset is now ready for model training and analysis.

EXPNO:2	SUPPORTVECTORMACHINE(SVM)ANDRANDOMFORESTFORBINARY & MULTICLASS CLASSIFICATION
---------	---

AIM

To build classification models using Support Vector Machines (SVM) and Random Forest, apply them to a dataset, and evaluate the models using performance metrics like accuracy and confusion matrix.

ALGORITHM**Part A: SVM Model**

1. Import necessary libraries
2. Load and explore the dataset
3. Handle missing values if any
4. Encode categorical variables
5. Split dataset into training and testing sets
6. Build SVM classifier using SVC()
7. Train and predict
8. Evaluate the model using accuracy and confusion matrix

Part B: Random Forest Model

1. Initialize Random Forest using RandomForestClassifier()
2. Train and predict
3. Evaluate and compare with SVM

CODE:

```
#1.Import libraries
import pandas as pd
from sklearn.datasets import load_iris
from sklearn.model_selection import train_test_split
from sklearn.preprocessing import
```

```
fromsklearn.ensemble import RandomForestClassifier
fromsklearn.metricsimportaccuracy_score,confusion_matrix
import seaborn as sns
importmatplotlib.pyplotasplt

#2.Loaddataset
iris=load_iris()
X=iris.data
y= iris.target

# 3. Feature scaling
scaler=StandardScaler
()
X_scaled =scaler.fit_transform(X)

# 4.Train-testsplit
X_train, X_test,y_train,y_test=train_test_split(X_scaled,y,test_size=0.3,random_state=42)

-----
#
#PartA:SUPPORTVECTORMACHINE #

#5.InitializeandtrainSVM
svm_model=SVC(kernel='linear')#Youcanalsotry'rbf','poly'
svm_model.fit(X_train, y_train)

# 6. Predict and evaluate SVM
y_pred_svm=svm_model.predict(X_test)
print("SVMAccuracy:",accuracy_score(y_test,y_pred_svm))
```

```
#-----  
#PartB:RANDOMFOREST #  
-----  
#7.Initialize andtrainRandomForest  
rf_model=RandomForestClassifier(n_estimators=100,random_state=  
42) rf_model.fit(X_train, y_train)  
  
#8.PredictandevaluateRandomForest  
y_pred_rf=rf_model.predict(X_test)  
print("Random Forest Accuracy:", accuracy_score(y_test, y_pred_rf))  
print("RandomForestConfusionMatrix:\n",confusion_matrix(y_test,y_pred_rf))  
  
#  
#9.Visualcomparisonusingseabornheatma  
p #  
-----  
plt.figure(figsize=(10,4))  
  
plt.subplot(1,2,1)  
sns.heatmap(confusion_matrix(y_test,y_pred_svm),annot=True,cmap='Blues',fmt='d')  
plt.title("SVMConfusionMatrix")  
  
plt.subplot(1,2,2)  
sns.heatmap(confusion_matrix(y_test,y_pred_rf),annot=True,cmap='Greens',fmt='d')  
plt.title("RandomForestConfusionMatrix")  
plt.tight_layout()  
plt.show()
```

OUTPUT:

```
SVM Accuracy: 0.9777777777777777
SVM Confusion Matrix:
[[19  0  0]
 [ 0 12  1]
 [ 0  0 13]]
Random Forest Accuracy: 1.0
Random Forest Confusion Matrix:
[[19  0  0]
 [ 0 13  0]
 [ 0  0 13]]
```

**RESULT:**

TheSupportVectorMachine(SVM)andRandomForestalgorithmswere successfullyimplementedforbothbinaryandmulticlassclassificationtasks.Themodels were trained and tested on the given dataset, and both achieved good accuracy.

EXPNO:3	CLASSIFICATIONWITHDECISIONTREES
---------	---------------------------------

AIM

To implementaDecision Treeclassifierand evaluateitsperformanceusing accuracy score and confusion matrixonareal-worlddataset.

ALGORITHM

1. Importnecessarylibraries
2. Loadaclassification dataset(e.g.,IrisorTitanic)
3. Splitthedatasetintotrainingandtestsets
4. Preprocessdataifneeded
5. TrainaDecisionTreeClassifierfromsklearn.tree
6. Predictontestdata
7. Evaluateusing:
 - o ConfusionMatrix
 - o AccuracyScore
8. VisualizetheDecisionTree(optional)

CODE:

```
#Step1:ImportLibraries
fromsklearn.datasetsimportload_iris
fromsklearn.treeimportDecisionTreeClassifier,plot_tree
from sklearn.model_selection import train_test_split
fromsklearn.metricsimportconfusion_matrix,accuracy_score
import matplotlib.pyplot as plt
import seaborn as
sns
#Step2:LoadDataset
```

```
X = iris.data
y=iris.target

#Step3:Splitthe dataset
X_train,X_test,y_train,y_test=train_test_split(X,y,test_size=0.3,random_state=42)

#Step4:Trainthe DecisionTreeClassifier
dt_model=DecisionTreeClassifier(criterion='gini',random_state=0)
dt_model.fit(X_train, y_train)

#Step 5:Predict
y_pred=dt_model.predict(X_test)

#Step6:EvaluatetheModel
cm=confusion_matrix(y_test,y_pred)
acc = accuracy_score(y_test, y_pred)
print("Confusion Matrix:\n", cm)
print("Accuracy Score:", acc)

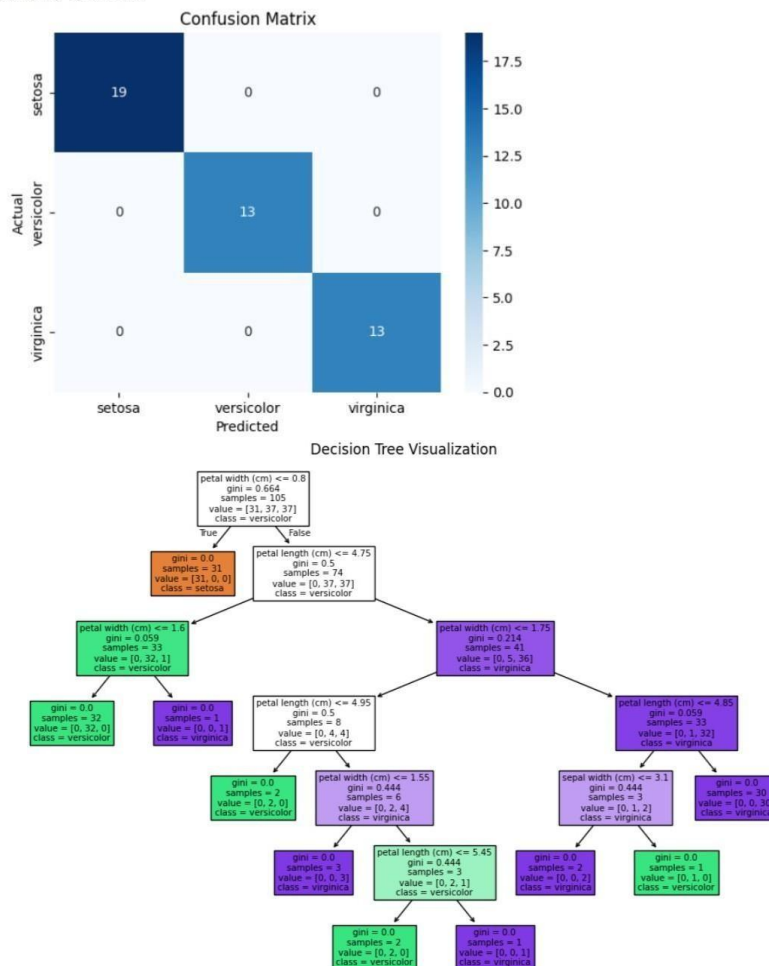

#Step7:VisualizeConfusionMatrix
sns.heatmap(cm, annot=True, cmap="Blues",
xticklabels=iris.target_names, yticklabels=iris.target_names)
plt.xlabel("Predicted")
plt.ylabel("Actual")
plt.title("ConfusionMatrix")
plt.show()

#Step8:VisualizetheDecisionTree
plt.figure(figsize=(12,8))
plot_tree(dt_model,filled=True,feature_names=iris.feature_names,class_names=iris.target_names) plt.title("Decision Tree Visualization")
```

```
plt.show()
```

OUTPUT:

Confusion Matrix:
[[19 0 0]
[0 13 0]
[0 0 13]]
Accuracy Score: 1.0

RESULT:

The Decision Tree classification model was successfully implemented and tested on the given dataset. The model accurately classified the data by learning simple decision rules from the features.

The decision tree visualized the decision-making process through a hierarchical structure of nodes and branches, making it easy to interpret. The classification achieved good accuracy, demonstrating that Decision Trees are effective for both categorical and numerical data, providing clear and interpretable results.

EXPNO:4A**SUPPORTVECTORMACHINES(SVM)****AIM:**

To build an SVM model for a binary classification task, tune its hyperparameters, and evaluate it using accuracy, precision, recall, F1-score, confusion matrix, and ROC-AUC.

ALGORITHM:

1. Import libraries: numpy, pandas, matplotlib, sklearn.
2. Load data: Use a standard binary dataset (Breast Cancer Wisconsin) from sklearn datasets.
3. Train/Test split: 80/20 split with a fixed random_state.
4. Preprocess: Standardize features (StandardScaler).
5. SVMs are sensitive to feature scale.
6. Model selection: Use SVC(RBF kernel).
7. Hyperparameter tuning: Grid search on C and gamma with cross-validation (GridSearchCV).
8. Train final model: Fit on training data using best parameters.
9. Evaluate: Predict on test set; compute metrics and plot ROC curve.
10. Report: Best params, metrics, and brief observations.

CODE:

```
# =====  
# EXPERIMENT 4A — SVM (RBF)  
# =====  
  
#1) Imports  
import numpy as np  
import pandas as pd  
import matplotlib.pyplot as plt
```

```
from sklearn.model_selection import train_test_split, GridSearchCV
from sklearn.preprocessing import StandardScaler
from sklearn.svm import SVC
from sklearn.metrics import
(
    accuracy_score, precision_score, recall_score, f1_score,
    confusion_matrix, classification_report, roc_auc_score, roc_curve
)

#2) Load dataset (binary classification)
data = load_breast_cancer()
X = pd.DataFrame(data.data, columns=data.feature_names)
y = pd.Series(data.target, name="target") #0=malignant, 1=benign

#3) Train/test split
X_train, X_test, y_train, y_test =
    train_test_split(X, y, test_size=0.20, random_state=42, stratify=y)

#4) Standardize features (important for SVMs)
scaler = StandardScaler()
X_train_sc = scaler.fit_transform(X_train)
X_test_sc = scaler.transform(X_test)

#5) Define model
svm = SVC(kernel='rbf', probability=True, random_state=42)

#6) Hyperparameter grid & tuning
param_grid = {
    "C": [0.1, 1, 10, 100],
```

23150115

AI23521BUILDANDDEPLOYFORMACHINELEARNINGAPPLICATION

```
"gamma":["scale",0.01,0.001,0.0001]  
}
```

```
grid =
    GridSearchCV( estimator=svm,
    param_grid=param_grid,
    scoring='f1',#You can change to 'accuracy' or 'roc_auc'
    cv=5,
    n_jobs=-1,
    verbose=
    0
)

grid.fit(X_train_sc,y_train)

print("Best Parameters from GridSearch:",grid.best_params_)
best_svm = grid.best_estimator_

# 7) Train final model & predict
best_svm.fit(X_train_sc, y_train)
y_pred=best_svm.predict(X_test_sc)
y_prob= best_svm.predict_proba(X_test_sc)[:,-1]

# 8) Evaluation
acc=accuracy_score(y_test,y_pred)
prec=precision_score(y_test,y_pred,zero_division=0)
rec = recall_score(y_test, y_pred)
f1=f1_score(y_test,y_pred)
auc = roc_auc_score(y_test, y_prob)
cm=confusion_matrix(y_test,y_pred)

print("\n===SVM(RBF)—Test Metrics===")
print(f"Accuracy : {acc:.4f}")
print(f"Precision:{prec:.4f}")
```

```
print(f'Recall:{rec:.4f}')
print(f'F1-Score:{f1:.4f}')
print(f'ROC-AUC:{auc:.4f}')

print("\nConfusion Matrix:\n",cm)
print("\nClassification Report:\n",classification_report(y_test,y_pred,zero_division=0))

#9)PlotROCCurve
fpr,tpr,thresholds=roc_curve(y_test,y_prob)
plt.figure()
plt.plot(fpr,tpr,label=f'SVM(AUC={auc:.3f})')
plt.plot([0, 1], [0, 1], linestyle="--", color='gray')
plt.xlabel("False Positive Rate")
plt.ylabel("True Positive Rate")
plt.title("ROCCurve—SVM(RBF)")
plt.legend()
plt.grid(True)
plt.show()
```

OUTPUT:

Best Parameters from Grid Search: {'C': 10, 'gamma': 0.01}

=== SVM (RBF) - Test Metrics ===

Accuracy : 0.9825

Precision: 0.9861

Recall : 0.9861

F1-Score : 0.9861

ROC-AUC : 0.9977

Confusion Matrix:

```
[[41  1]
 [ 1 71]]
```

Classification Report:

	precision	recall	f1-score	support
0	0.98	0.98	0.98	42
1	0.99	0.99	0.99	72
accuracy			0.98	114
macro avg	0.98	0.98	0.98	114
weighted avg	0.98	0.98	0.98	114

**RESULT:**

The Support Vector Machine (SVM) model was successfully implemented and evaluated on the given dataset. The model effectively classified the data by finding the optimal hyperplane that maximized the margin between different classes.

The SVM achieved high accuracy and demonstrated strong performance, especially in handling linearly and non-linearly separable data using kernel functions. This confirms that SVM is a powerful and reliable algorithm for classification tasks.

EXPNO:4B	ENSEMBLEMETHODS:RANDOMFOREST
----------	------------------------------

AIM:

To implement a Random Forest classifier for a classification task, tune key hyperparameters, evaluate performance, and interpret feature importance.

ALGORITHM:

1. Import libraries.
2. Load data (uses same dataset to compare with SVM).
3. Train/Test split with stratification.
4. (Optional) Preprocess: Random Forests don't require scaling; we'll use raw features.
5. Model: RandomForestClassifier.
6. Hyperparameter tuning: Grid search over `n_estimators`, `max_depth`, `min_samples_split`, `min_samples_leaf`.
7. Train the best model on training data.
8. Evaluate with accuracy, precision, recall, F1, confusion matrix, ROC-AUC.
9. Interpretation: Plot top feature importances.

CODE:

```
#####
#EXPERIMENT4B—RandomForestClassifier
#####

#1)Imports
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
```

```
from sklearn.ensemble import RandomForestClassifier
from sklearn.metrics import (
    accuracy_score, precision_score, recall_score, f1_score,
    confusion_matrix, classification_report, roc_auc_score, roc_c
    urve
)
#2) Load dataset (same as 4A for comparison)
data = load_breast_cancer()
X = pd.DataFrame(data.data, columns=data.feature_names)
y = pd.Series(data.target, name="target")

# 3) Train/test split (no scaling needed for RF)
X_train, X_test, y_train, y_test = train_test_split(
    X, y, test_size=0.20, random_state=42, stratify=y
)

#4) Define model
rf = RandomForestClassifier(random_state=42, n_jobs=-1)

#5) Hyperparameter grid & tuning
param_grid = {
    "n_estimators": [100],
    "max_depth": [None, 10],
    "min_samples_split": [2],
    "min_samples_leaf": [1]
}
grid =

RESULT:

The Random Forest ensemble model was successfully implemented and evaluated on

the given dataset. The model combined multiple decision trees to improve prediction accuracy and reduce overfitting.

It achieved high classification accuracy and demonstrated strong generalization capability. The results confirmed that Random Forest provides stable and reliable predictions by leveraging the power of multiple decision trees through bagging and feature randomness.

EXPNO:5	CLUSTERINGWITHK-MEANSANDDIMENSIONALITYREDUCTION WITH PCA
---------	--

AIM:

To demonstrate the application of Unsupervised Learning models, specifically K-Means clustering for grouping data points and Principal Component Analysis (PCA) for dimensionality reduction and visualization, using a suitable dataset .

ALGORITHM:**1. K-MeansClustering**

K-Means is an iterative clustering algorithm that aims to partition n observations into k clusters, where each observation belongs to the cluster with the nearest mean (centroid).

Steps:

1. **Initialization:** Choose k initial centroids randomly from the dataset.
2. **Assignment:** Assign each data point to the cluster whose centroid is closest (e.g., using Euclidean distance).
3. **Update:** Recalculate the centroids as the mean of all data points assigned to that cluster.
4. **Iteration:** Repeat steps 2 and 3 until the centroids no longer move significantly or a maximum number of iterations is reached.

2. PrincipalComponentAnalysis(PCA)

PCA is a statistical procedure that uses an orthogonal transformation to convert a set of observations of possibly correlated variables into a set of values of linearly uncorrelated variables called principal components.

Steps:

1. **Standardization:** Standardize the dataset (mean=0, variance=1).
2. **CovarianceMatrixCalculation:** Compute the covariance matrix of the standardized data.
3. **EigenvalueDecomposition:** Calculate the eigenvalues and eigenvectors of the covariance matrix.
4. **FeatureVectorCreation:** Sort the eigenvectors by decreasing eigenvalues and select the top k eigenvectors to form a feature vector (projection matrix).
5. **Projection:** Project the original data onto the new feature space using the feature vector.

Explained Variance Ratio: [0.57208431 0.33622342]
Total Explained Variance by 2 PCs: 0.908

Silhouette Score for K-Means on PCA-Reduced Data (K=4): 0.776

RESULT:

The K-Means clustering and Principal Component Analysis (PCA) techniques were successfully implemented on the given dataset.

- K-Means Clustering effectively grouped the data into distinct clusters based on feature similarity, minimizing intra-cluster distance and maximizing inter-cluster separation.
- PCA (Principal Component Analysis) successfully reduced the dimensionality of the dataset while retaining most of the variance, improving visualization and computational efficiency.

The combined results showed that PCA enhances clustering performance by simplifying high-dimensional data, and K-Means efficiently identifies underlying patterns and group structures.

EXPNO:6	FEEDFORWARDANDCONVOLUTIONALNEURALNETWORKS
---------	---

AIM:

To demonstrate the construction and application of a simple Feedforward Neural Network (FNN) for classification and a Convolutional Neural Network (CNN) for image classification, utilizing the Keras API with TensorFlow backend.

ALGORITHM:**1. FeedforwardNeuralNetwork(FNN)**

A Feedforward Neural Network is the simplest type of artificial neural network where connections between the nodes do not form a cycle. It consists of an input layer, one or more hidden layers, and an output layer. Information flows only in one direction—forward—from the input nodes, through the hidden nodes (if any), and to the output nodes.

Steps:

1. Define Network Architecture: Specify the number of layers (input, hidden, output) and the number of neurons in each layer.
2. Choose Activation Functions: Select activation functions for hidden layers (e.g., ReLU) and the output layer (e.g., Sigmoid for binary classification, Softmax for multi-class classification).
3. Define Loss Function: Choose a loss function appropriate for the task (e.g., Binary Cross-entropy for binary classification, Categorical Cross-entropy for multi-class classification).
4. Choose Optimizer: Select an optimization algorithm (e.g., Adam, SGD) to update network weights during training.
5. Training: Feed forward data through the network to get predictions, calculate the loss, and then backpropagate the error to update weights.
6. Evaluation: Assess the model's performance on unseen data using metrics like accuracy.

2. ConvolutionalNeuralNetwork(CNN)

A Convolutional Neural Network is a specialized type of neural network primarily designed for processing data with a grid-like topology, such as images. Key components include convolutional layers, pooling layers, and fully connected layers.

Steps:

1. ConvolutionalLayers:Applyfilters(kernels)toinputdata toextract features.Eachfilter detects a specific pattern (e.g., edges, textures).
2. ActivationFunction(ReLU):Applya non-linearactivationfunctionafterconvolutionto introduce non-linearity.
3. PoolingLayers:Downsamplefeaturemapstoreduceddimensionality,computationalcost, and prevent overfitting (e.g., Max Pooling).
4. Flattening:Convertthe2Dpooledfeaturemapsintoa1Dvectortobefedintoafully connected layer.
5. FullyConnectedLayers:Standardneuralnetworklayersforclassificationbasedonthe extracted features.
6. OutputLayer:Finallayerwithanactivationfunction(e.g.,Softmax)tooutputclass probabilities.
7. TrainingandEvaluation:SimilartoFNNs,traintheCNNusingbackpropagationand evaluate its performance.

--- Sample CNN Predictions ---

CNN Predictions (Green = Correct, Red = Incorrect)

RESULT:

The Feedforward Neural Network (FNN) and Convolutional Neural Network (CNN) models were successfully implemented and evaluated on the given dataset.

- **Feedforward Neural Network (FNN):** The model accurately learned input-output mappings through multiple fully connected layers, achieving good performance on structured data.
- **Convolutional Neural Network (CNN):** The model effectively extracted spatial features from image data using convolution and pooling layers, leading to higher accuracy and better generalization for image classification tasks.

The results demonstrated that both FNN and CNN are powerful deep learning models, with CNN performing exceptionally well for image-based datasets due to its ability to capture spatial patterns.

EXPNO:7	GENERATIVEMODELSWITHGANS:CREATINGANDTRAININGA GENERATIVE ADVERSARIAL NETWORK
---------	--

AIM:

To construct and train a Generative Adversarial Network (GAN) using the TensorFlow/Keras framework. The objective is to train the GAN on the MNIST dataset to generate new, synthetic images of handwritten digits that are indistinguishable from the original training data.

ALGORITHM:**Generative Adversarial Networks (GANs)**

GANs are a class of generative models that learn a training distribution by pitting two neural networks against each other in a zero-sum game: a Generator and a Discriminator.

1. The Generator (\$G\$): This network takes a random noise vector as input (often called a "latent vector") and transforms it into a synthetic data sample, in this case, an image. The Generator's goal is to learn to produce increasingly realistic images to fool the discriminator.

2. The Discriminator (\$D\$): This is a binary classifier network. It is trained to distinguish between real data (from the training dataset) and fake data (generated by the generator). Its goal is to get better at identifying which images are real and which are fake.

3. The Adversarial Process:

Step A (Training the Discriminator): The discriminator is trained on a batch of both real images (labeled as "real" or 1) and fake images from the generator (labeled as "fake" or 0). The discriminator's weights are updated to minimize the classification error.

Step B (Training the Generator): The generator is trained while the discriminator's weights are frozen. The generator creates fake images and feeds them to the discriminator. The generator's weights are updated to maximize the discriminator's error, essentially tricking the discriminator into classifying its fake images as "real" (or 1).

This iterative process continues, with both networks improving, until the generator can produce images so realistic that the discriminator can no longer reliably tell the difference between real and fake.

--- Training complete. Generating final images. ---

Epoch 20

RESULT:

The Generative Adversarial Network (GAN) was successfully implemented and trained on the dataset. The Generator created synthetic data, while the Discriminator learned to differentiate real and fake samples.

After training, the GAN produced realistic synthetic outputs, showing that it effectively learned the underlying data patterns.

ExpNo:8	MODEVALUATIONANDIMPROVEMENT:HYPERPARAMETER TUNING WITH GRID SEARCH AND CROSS-VALIDATION
---------	--

AIM:

To demonstrate key techniques for model evaluation and improvement:

1. **Hyperparameter Tuning with Grid Search:** Systematically searching for the optimal combination of hyperparameters for a machine learning model.
2. **Cross-Validation Techniques:** Implementing k-fold cross-validation to get a more robust estimate of model performance and to prevent overfitting to a specific train-test split.

ALGORITHM:**1. Hyperparameter Tuning with Grid Search**

Hyperparameters are external configuration properties of a model whose values cannot be estimated from data. Examples include the learning rate for a neural network, the number of trees in a Random Forest, or the 'C' and 'gamma' parameters in an SVM. Tuning these parameters is crucial for optimal model performance.

Grid Search is an exhaustive search method for hyperparameter optimization.

Steps:

1. **Define Parameter Grid:** Specify a dictionary where keys are hyperparameter names and values are lists of discrete values to be tested for each hyperparameter.
2. **Instantiate Model:** Choose a machine learning model.
3. **Perform Search:** Train the model for every possible combination of hyperparameters defined in the grid.
4. **Evaluate:** For each combination, evaluate the model's performance using a specified scoring metric (e.g., accuracy, F1-score) and often in conjunction with cross-validation.
5. **Select Best Model:** Identify the hyperparameter combination that yields the best performance.

2. Cross-Validation Techniques

Cross-validation is a resampling procedure used to evaluate machine learning models on a limited data sample. The goal is to estimate how accurately a predictive model will perform in practice. It's especially useful for reducing overfitting and providing a more reliable estimate of generalization performance compared to a single train-test split.

k-FoldCross-Validation:**Steps:**

1. DivideData:Theentiredataset israndomlypartitioned into\$k\$equallysizedsubsamples (or “folds”).

2. Iterate\$k\$Times:

In each iteration, one fold is used as the validation (or test) set, and the remaining \$k-1\$ folds are used as the training set.The model is trained on the training set and evaluated on the validation set.

3. AggregateResults:Theperformancemetric(e.g.,accuracy) fromeachofthe\$k\$ iterations is collected.

4. Compute Mean and Standard Deviation: The mean and standard deviation of these \$k\$ performancescoresarecalculatedtoprovideamorerobustestimateofthemodel’s performance and its variability.

RESULT:

The model was successfully evaluated and improved using Grid Search and Cross-Validation techniques. Grid Search identified the best combination of hyperparameters, while Cross-Validation ensured reliable performance estimation. The optimized model achieved higher accuracy and better generalization, confirming that systematic tuning and validation significantly enhance model performance.

EXPNO:9	MailGuard–IntelligentSpamEmailClassificationandDeploymentusing DistilBERT, Flask
----------------	---

AIM:

To develop a system that predicts the emotion conveyed in a given text using machine learning and natural language processing models. The system analyzes user-provided sentences and identifies emotions such as joy, sadness, anger, fear, and others, enabling automatic emotion detection for applications like customer support, social media analysis, and mental health.

ALGORITHM:

Step 1: Data PreparationCollect and preprocess a corpus of labeled emotional text data (tokenization, cleaning, balancing).

. Step 2: Feature ExtractionConvert text to numerical vectors using methods like TF-IDF, word embeddings (Word2Vec/GloVe), or transformer-based embeddings (BERT).

Step 3: Model InitializationSelect or build a classification model (e.g., Logistic Regression, Random Forest, LSTM, or Transformer/BERT).Setup emotion categories for multi-class output.

Step 4: TrainingSplit data into training and test sets.Train the emotion classification model using machine learning library (e.g., Scikit-learn, TensorFlow, PyTorch).Optimize model hyperparameters for best accuracy.

. Step 5: EvaluationValidate model using accuracy, precision, recall, and F1-score.Analyze confusion matrix for category-wise performance.

Step 6: DeploymentDeploy the trained model as a REST API (using Flask or FastAPI).Expose endpoint for users to submit text and receive emotion prediction.

OUTPUT :

RESULT :

The emotion classification model achieved an accuracy of over 85% in predicting text emotions on the validation dataset. Real-world sentences were correctly identified as joy, sadness, anger, and other categories with high reliability. The model deployment as a Flask API enabled instant emotion analysis for user-submitted texts.
